

# PreVeil Email Relay

Let customers and partners send you CUI from their compliant email system — while maintaining your compliance boundary.

## 🛡️ The Foundation

Thousands of defense contractors use PreVeil's end-to-end encrypted email every day to protect CUI and meet CMMC Level 2 and NIST 800-171 requirements. When users need to share CUI with external parties, recipients can access via the free PreVeil Express Portal and begin exchanging encrypted email and files in minutes.

## ✂️ Where the Relay Helps

Some organizations you collaborate with — a government agency using a .mil email address or a Prime running MS GCC High — may prefer to leverage their existing compliant email environment. The Email Relay bridges your PreVeil environment to their compliant system, maintaining your CMMC compliance boundary while making collaboration effortless for both sides.

## ⚙️ How it Works

The Email Relay is a PreVeil managed service that complements our encrypted cloud service. A unique secure subdomain (e.g., @secure.yourcompany.com) routes inbound email through the Relay into your compliant PreVeil email environment — separate from your commercial email. Incoming email sent to the secure subdomain automatically flows through the Relay and into PreVeil.

For outbound email, the experience is completely seamless — PreVeil automatically tracks which recipients need Relay routing versus those using PreVeil enterprise or free accounts. Admins manage authorized third-party domains and email addresses through PreVeil's Admin Console.

## 🛡️ Benefits

The Email Relay maintains your compliance boundary with FIPS 140-3 validated end-to-end encryption within PreVeil and TLS 1.3 encryption-in-transit to or from the third party's server. The Relay is affordable — just a few dollars per user per month — with no user training necessary. PreVeil manages the setup and maintenance, so getting started is hassle-free and long-term management is seamless.

### Two paths to share CUI — both keep you compliant
