

Discover, Secure, and Monitor CUI with Confidence

The Biggest CMMC Question: Where Is Your CUI?

Years of contracts, emails, engineering data, and legacy repositories leave Controlled Unclassified Information (CUI) scattered across the enterprise. Without knowing exactly where CUI resides, organizations struggle to accurately scope their CMMC environment, protect sensitive information, and maintain compliance over time.

Discover, Secure, and Monitor CUI with Confidence

Teramis discovers and validates CUI across Microsoft 365, file shares, endpoints, emails, scanned documents, images, PDFs, and CAD files. Purpose-built for CUI and DoD requirements, Teramis delivers highly accurate identification while dramatically reducing false positives compared to generic data discovery and DLP tools.

Once identified, CUI can be secured within a PreVeil enclave protected by FIPS 140-3 validated end-to-end encryption. Teramis then provides ongoing monitoring to detect new CUI, unauthorized movement, or potential spillage.

The Result: A Defensible, Assessment-Ready CUI Boundary

- **Scoping:** Define your compliance boundary based on where CUI actually resides, reducing over-scoping costs and under-scoping risk.
- **Assessment Preparation:** Validate and document CUI containment using DoD-aligned statistical sampling methodologies, producing evidence assessors can trust.
- **Post-Certification:** Maintain visibility into CUI location and movement to support annual affirmations and ongoing compliance.

Find it. Secure it. Keep it secure.
